
PyFR Documentation

Release 1.12.0

Imperial College London

Nov 22, 2021

CONTENTS

| | |
|--|-----------|
| 1 Installation | 3 |
| 1.1 Quick-start | 3 |
| 1.1.1 macOS | 3 |
| 1.1.2 Ubuntu | 4 |
| 1.2 Compiling from source | 4 |
| 1.2.1 Dependencies | 4 |
| 2 User Guide | 7 |
| 2.1 Running PyFR | 7 |
| 2.1.1 Running in Parallel | 8 |
| 2.2 Configuration File (.ini) | 8 |
| 2.2.1 Backends | 8 |
| 2.2.2 Systems | 10 |
| 2.2.3 Boundary and Initial Conditions | 17 |
| 2.2.4 Nodal Point Sets | 20 |
| 2.2.5 Plugins | 24 |
| 2.2.6 Additional Information | 29 |
| 3 Developer Guide | 31 |
| 3.1 A Brief Overview of the PyFR Framework | 31 |
| 3.1.1 Where to Start | 31 |
| 3.1.2 Controller | 31 |
| 3.1.3 Stepper | 35 |
| 3.1.4 PseudoStepper | 42 |
| 3.1.5 System | 47 |
| 3.1.6 Elements | 50 |
| 3.1.7 Interfaces | 56 |
| 3.1.8 Backend | 59 |
| 3.1.9 Pointwise Kernel Provider | 62 |
| 3.1.10 Kernel Generator | 64 |
| 3.2 PyFR-Mako | 66 |
| 3.2.1 PyFR-Mako Kernels | 66 |
| 3.2.2 PyFR-Mako Macros | 67 |
| 3.2.3 Syntax | 67 |
| 4 Examples | 69 |
| 4.1 Euler Equations | 69 |
| 4.1.1 2D Euler Vortex | 69 |
| 4.2 Compressible Navier–Stokes Equations | 71 |
| 4.2.1 2D Couette Flow | 71 |

| | | |
|--------------|--|-----------|
| 4.3 | Incompressible Navier–Stokes Equations | 72 |
| 4.3.1 | 2D Incompressible Cylinder Flow | 72 |
| 5 | Indices and Tables | 73 |
| Index | | 75 |

PyFR 1.12.0 is an open-source flow solver that uses the high-order flux reconstruction method. For more information on the PyFR project visit our [website](#), or to ask a question visit our [forum](#).

Contents:

INSTALLATION

1.1 Quick-start

PyFR 1.12.0 can be installed using `pip` and `virtualenv`, as shown in the quick-start guides below.

Alternatively, PyFR 1.12.0 can be installed from source, see [Compiling from source](#).

1.1.1 macOS

We recommend using the package manager `homebrew`. Open the terminal and install the dependencies with the following commands:

```
brew install python3 open-mpimetis  
pip3 install virtualenv
```

For visualisation of results, either install Paraview from the command line:

```
brew cask install paraview
```

or download the app from the Paraview [website](#). Then create a virtual environment and activate it:

```
virtualenv --python=python3 ENV3  
source ENV3/bin/activate
```

Finally install PyFR with `pip` in the virtual environment:

```
pip install pyfr
```

This concludes the installation. In order to run PyFR with the OpenMP backend (see [Running PyFR](#)), use the following settings in the [Configuration File \(.ini\)](#):

```
[backend-openmp]  
cc = gcc-8
```

Note the version of the compiler which must support the `openmp` flag. This has been tested on macOS 10.14.

1.1.2 Ubuntu

Open the terminal and install the dependencies with the following commands:

```
sudo apt install python3 python3-pip libopenmpi-dev openmpi-bin  
sudo apt install metis libmetis-dev  
pip3 install virtualenv
```

For visualisation of results, either install Paraview from the command line:

```
sudo apt install paraview
```

or download the app from the Paraview [website](#). Then create a virtual environment and activate it:

```
python3 -m virtualenv ENV3  
source ENV3/bin/activate
```

Finally install PyFR with `pip` in the virtual environment:

```
pip install pyfr
```

This concludes the installation.

This has been tested on Ubuntu 18.04.

1.2 Compiling from source

PyFR can be obtained [here](#). To install the software from source, use the provided `setup.py` installer or add the root PyFR directory to `PYTHONPATH` using:

```
user@computer ~/PyFR$ export PYTHONPATH=.:${PYTHONPATH}
```

When installing from source, we strongly recommend using `pip` and `virtualenv` to manage the Python dependencies.

1.2.1 Dependencies

PyFR 1.12.0 has a hard dependency on Python 3.6+ and the following Python packages:

1. `appdirs` >= 1.4.0
2. `gimmik` >= 2.0
3. `h5py` >= 2.6
4. `mako` >= 1.0.0
5. `mpi4py` >= 3.0
6. `numpy` >= 1.20
7. `pytools` >= 2016.2.1

Note that due to a bug in `numpy`, PyFR is not compatible with 32-bit Python distributions.

1.2.1.1 CUDA Backend

The CUDA backend targets NVIDIA GPUs with a compute capability of 3.0 or greater. The backend requires:

1. `CUDA >= 8.0`

1.2.1.2 HIP Backend

The HIP backend targets AMD GPUs which are supported by the ROCm stack. The backend requires:

1. `ROCM >= 4.0`
2. `rocBLAS >= 2.32.0`

1.2.1.3 OpenCL Backend

The OpenCL backend targets a range of accelerators including GPUs from AMD, Intel, and NVIDIA. The backend requires:

1. `OpenCL`
2. `pyopencl >= 2015.2.4`
3. `CLBlast`

1.2.1.4 OpenMP Backend

The OpenMP backend targets multi-core CPUs. The backend requires:

1. `GCC >= 4.9` or another C compiler with OpenMP support
2. Optionally `libxsmm >= 1.15` compiled as a shared library (`STATIC=0`) with `BLAS=0`

1.2.1.5 Parallel

To partition meshes for running in parallel it is also necessary to have one of the following partitioners installed:

1. `metis >= 5.0`
2. `scotch >= 6.0`

USER GUIDE

For information on how to install PyFR see [Installation](#).

2.1 Running PyFR

PyFR 1.12.0 uses three distinct file formats:

1. `.ini` — configuration file
2. `.pyfrm` — mesh file
3. `.pyfrs` — solution file

The following commands are available from the `pyfr` program:

1. `pyfr import` — convert a `Gmsh` `.msh` file into a PyFR `.pyfrm` file.

Example:

```
pyfr import mesh.msh mesh.pyfrm
```

2. `pyfr partition` — partition an existing mesh and associated solution files.

Example:

```
pyfr partition 2 mesh.pyfrm solution.pyfrs .
```

3. `pyfr run` — start a new PyFR simulation. Example:

```
pyfr run mesh.pyfrm configuration.ini
```

4. `pyfr restart` — restart a PyFR simulation from an existing solution file. Example:

```
pyfr restart mesh.pyfrm solution.pyfrs
```

5. `pyfr export` — convert a PyFR `.pyfrs` file into an unstructured VTK `.vtu` or `.pvtu` file. If a `-k` flag is provided with an integer argument then `.pyfrs` elements are converted to high-order VTK cells which are exported, where the order of the VTK cells is equal to the value of the integer argument. Example:

```
pyfr export -k 4 mesh.pyfrm solution.pyfrs solution.vtu
```

If a `-d` flag is provided with an integer argument then `.pyfrs` elements are subdivided into linear VTK cells which are exported, where the number of sub-divisions is equal to the value of the integer argument. Example:

```
pyfr export -d 4 mesh.pyfrm solution.pyfrs solution.vtu
```

If no flags are provided then .pyfrs elements are converted to high-order VTK cells which are exported, where the order of the cells is equal to the order of the solution data in the .pyfrs file.

2.1.1 Running in Parallel

PyFR can be run in parallel. To do so prefix `pyfr` with `mpiexec -n <cores/devices>`. Note that the mesh must be pre-partitioned, and the number of cores or devices must be equal to the number of partitions.

2.2 Configuration File (.ini)

The .ini configuration file parameterises the simulation. It is written in the [INI](#) format. Parameters are grouped into sections. The roles of each section and their associated parameters are described below. Note that both ; and # may be used as comment characters.

2.2.1 Backends

The backend sections detail how the solver will be configured for a range of different hardware platforms. If a hardware specific backend section is omitted, then PyFR will fall back to built-in default settings.

2.2.1.1 [backend]

Parameterises the backend with

1. `precision` — number precision:

`single | double`

2. `rank-allocator` — MPI rank allocator:

`linear | random`

Example:

```
[backend]
precision = double
rank-allocator = linear
```

2.2.1.2 [backend-cuda]

Parameterises the CUDA backend with

1. `device-id` — method for selecting which device(s) to run on:

`int | round-robin | local-rank`

2. `mpi-type` — type of MPI library that is being used:

`standard | cuda-aware`

3. `block-1d` — block size for one dimensional pointwise kernels:

`int`

4. `block-2d` — block size for two dimensional pointwise kernels:

int

Example:

```
[backend-cuda]
device-id = round-robin
mpi-type = standard
block-1d = 64
block-2d = 128
```

2.2.1.3 [backend-hip]

Parameterises the HIP backend with

1. `device-id` — method for selecting which device(s) to run on:

int | local-rank

2. `mpi-type` — type of MPI library that is being used:

`standard | hip-aware`

3. `block-1d` — block size for one dimensional pointwise kernels:

int

4. `block-2d` — block size for two dimensional pointwise kernels:

int

Example:

```
[backend-hip]
device-id = local-rank
gimmik-max-nnz = 512
mpi-type = standard
block-1d = 64
block-2d = 128
```

2.2.1.4 [backend-opencl]

Parameterises the OpenCL backend with

1. `platform-id` — for selecting platform id:

int | string

2. `device-type` — for selecting what type of device(s) to run on:

`all | cpu | gpu | accelerator`

3. `device-id` — for selecting which device(s) to run on:

int | string | local-rank

4. `gimmik-max-nnz` — cutoff for GiMMiK in terms of the number of non-zero entries in a constant matrix:

int

5. `local-size-1d` — local work size for one dimensional pointwise kernels:

int

6. local-size-2d — local work size for two dimensional pointwise kernels:

int

Example:

```
[backend-opencl]
platform-id = 0
device-type = gpu
device-id = local-rank
gimmik-max-nnz = 512
local-size-1d = 16
local-size-2d = 128
```

2.2.1.5 [backend-openmp]

Parameterises the OpenMP backend with

1. cc — C compiler:

string

2. cflags — additional C compiler flags:

string

3. alignb — alignment requirement in bytes; must be a power of two and at least 32:

int

4. gimmik-max-nnz — cutoff for GiMMiK in terms of the number of non-zero entires in a constant matrix:

int

5. libxsmm-max-sz — cutoff for libxsmm in terms of the number of entires in a constant matrix:

int

Example:

```
[backend-openmp]
cc = gcc
```

2.2.2 Systems

These sections of the input file setup and control the physical system being solved, as well as characteristics of the spatial and temporal schemes to be used.

2.2.2.1 [constants]

Sets constants used in the simulation

1. `gamma` — ratio of specific heats for `euler | navier-stokes`:

float

2. `mu` — dynamic viscosity for `navier-stokes`:

float

3. `nu` — kinematic viscosity for `ac-navier-stokes`:

float

4. `Pr` — Prandtl number for `navier-stokes`:

float

5. `cpTref` — product of specific heat at constant pressure and reference temperature for `navier-stokes` with Sutherland's Law:

float

6. `cpTs` — product of specific heat at constant pressure and Sutherland temperature for `navier-stokes` with Sutherland's Law:

float

7. `ac-zeta` — artificial compressibility factor for `ac-euler | ac-navier-stokes`

float

Other constant may be set by the user which can then be used throughout the `.ini` file.

Example:

```
[constants]
; PyFR Constants
gamma = 1.4
mu = 0.001
Pr = 0.72

; User Defined Constants
V_in = 1.0
P_out = 20.0
```

2.2.2.2 [solver]

Parameterises the solver with

1. `system` — governing system:

`euler | navier-stokes | ac-euler | ac-navier-stokes`

where

`navier-stokes` requires

- `viscosity-correction` — viscosity correction:

`none | sutherland`

- **shock-capturing** — shock capturing scheme:
`none | artificial-viscosity`
- 2. **order** — order of polynomial solution basis:
int
- 3. **anti-alias** — type of anti-aliasing:
`flux | surf-flux | flux, surf-flux`

Example:

```
[solver]
system = navier-stokes
order = 3
anti-alias = flux
viscosity-correction = none
shock-capturing = artificial-viscosity
```

2.2.2.3 [solver-time-integrator]

Parameterises the time-integration scheme used by the solver with

1. **formulation** — formulation:

`std | dual`

where

`std` requires

- **scheme** — time-integration scheme
`euler | rk34 | rk4 | rk45 | tvd-rk3`
- **tstart** — initial time
float
- **tend** — final time
float
- **dt** — time-step
float
- **controller** — time-step controller
`none | pi`
where
pi only works with `rk34` and `rk45` and requires
 - **atol** — absolute error tolerance
float
 - **rtol** — relative error tolerance
float
 - **errest-norm** — norm to use for estimating the error

```
uniform|12
  - safety-fact — safety factor for step size adjustment (suitable range 0.80-0.95)
    float
  - min-fact — minimum factor by which the time-step can change between iterations
    (suitable range 0.1-0.5)
    float
  - max-fact — maximum factor by which the time-step can change between iterations
    (suitable range 2.0-6.0)
    float
  - dt-max — maximum permissible time-step
    float

dual requires
  • scheme — time-integration scheme
    backward-euler|bdf2|bdf3
  • pseudo-scheme — pseudo time-integration scheme
    euler|rk34|rk4|rk45|tvd-rk3|vermeire
  • tstart — initial time
    float
  • tend — final time
    float
  • dt — time-step
    float
  • pseudo-dt — pseudo time-step
    float
  • controller — pseudo time-step controller
    none
  • pseudo-niters-max — minimum number of iterations
    int
  • pseudo-niters-min — maximum number of iterations
    int
  • pseudo-resid-tol — pseudo residual tolerance
    float
  • pseudo-resid-norm — pseudo residual norm
    uniform|12
  • pseudo-controller — pseudo time-step controller
```

none | local-pi

where

local-pi only works with rk34 and rk45 and requires

- atol — absolute error tolerance

float

- safety-fact — safety factor for pseudo time-step size adjustment (suitable range 0.80-0.95)

float

- min-fact — minimum factor by which the local pseudo time-step can change between iterations (suitable range 0.98-0.998)

float

- max-fact — maximum factor by which the local pseudo time-step can change between iterations (suitable range 1.001-1.01)

float

- pseudo-dt-max-mult — maximum permissible local pseudo time-step given as a multiplier of pseudo-dt (suitable range 2.0-5.0)

float

Example:

```
[solver-time-integrator]
formulation = std
scheme = rk45
controller = pi
tstart = 0.0
tend = 10.0
dt = 0.001
atol = 0.00001
rtol = 0.00001
errest-norm = 12
safety-fact = 0.9
min-fact = 0.3
max-fact = 2.5
```

2.2.2.4 [solver-dual-time-integrator-multip]

Parameterises multi-p for dual time-stepping with

1. pseudo-dt-fact — factor by which the pseudo time-step size changes between multi-p levels:

float

2. cycle — nature of a single multi-p cycle:

`[(order,nsteps), (order,nsteps), ... (order,nsteps)]`

where order in the first and last bracketed pair must be the overall polynomial order used for the simulation, and order can only change by one between subsequent bracketed pairs

Example:

```
[solver-dual-time-integrator-multip]
pseudo-dt-fact = 2.3
cycle = [(3, 1), (2, 1), (1, 1), (0, 2), (1, 1), (2, 1), (3, 3)]
```

2.2.2.5 [solver-interfaces]

Parameterises the interfaces with

1. **riemann-solver** — type of Riemann solver:

`rusanov | hll | hllc | roe | roem`

where

`hll | hllc | roe | roem` do not work with `ac-euler | ac-navier-stokes`

2. **ldg-beta** — beta parameter used for LDG:

float

3. **ldg-tau** — tau parameter used for LDG:

float

Example:

```
[solver-interfaces]
riemann-solver = rusanov
ldg-beta = 0.5
ldg-tau = 0.1
```

2.2.2.6 [solver-source-terms]

Parameterises solution, space (x, y, [z]), and time (t) dependent source terms with

1. **rho** — density source term for `euler | navier-stokes`:

string

2. **rhou** — x-momentum source term for `euler | navier-stokes`:

string

3. **rhov** — y-momentum source term for `euler | navier-stokes`:

string

4. **rhow** — z-momentum source term for `euler | navier-stokes`:

string

5. **E** — energy source term for `euler | navier-stokes`:

string

6. **p** — pressure source term for `ac-euler | ac-navier-stokes`:

string

7. **u** — x-velocity source term for `ac-euler | ac-navier-stokes`:

string

8. **v** — y-velocity source term for ac-euler | ac-navier-stokes:

string

9. **w** — w-velocity source term for ac-euler | ac-navier-stokes:

string

Example:

```
[solver-source-terms]
rho = t
rhou = x*y*sin(y)
rhov = z*rho
rhow = 1.0
E = 1.0/(1.0+x)
```

2.2.2.7 [solver-artificial-viscosity]

Parameterises artificial viscosity for shock capturing with

1. **max-artvisc** — maximum artificial viscosity:

float

2. **s0** — sensor cut-off:

float

3. **kappa** — sensor range:

float

Example:

```
[solver-artificial-viscosity]
max-artvisc = 0.01
s0 = 0.01
kappa = 5.0
```

2.2.2.8 [soln-filter]

Parameterises an exponential solution filter with

1. **nsteps** — apply filter every nsteps:

int

2. **alpha** — strength of filter:

float

3. **order** — order of filter:

int

4. **cutoff** — cutoff frequency below which no filtering is applied:

int

Example:

```
[soln-filter]
nsteps = 10
alpha = 36.0
order = 16
cutoff = 1
```

2.2.3 Boundary and Initial Conditions

These sections allow users to set the boundary and initial conditions of calculations.

2.2.3.1 [soln-bcs-name]

Parameterises constant, or if available space (x, y, [z]) and time (t) dependent, boundary condition labelled *name* in the .pyfrm file with

1. type — type of boundary condition:

```
ac-char-riem-inv | ac-in-fv | ac-out-fp | char-riem-inv | no-slp-adia-wall
| no-slp-isot-wall | no-slp-wall | slp-adia-wall | slp-wall | sub-in-frv |
sub-in-ftptang | sub-out-fp | sup-in-fa | sup-out-fn
```

where

ac-char-riem-inv only works with ac-euler | ac-navier-stokes and requires

- ac-zeta — artificial compressibility factor for boundary (increasing ac-zeta makes the boundary less reflective allowing larger deviation from the target state)

float

- nitors — number of Newton iterations

int

- p — pressure

float | string

- u — x-velocity

float | string

- v — y-velocity

float | string

- w — z-velocity

float | string

ac-in-fv only works with ac-euler | ac-navier-stokes and requires

- u — x-velocity

float | string

- v — y-velocity

float | string

- w — z-velocity

float | string

`ac-out-fp` only works with `ac-euler` | `ac-navier-stokes` and requires

- `p` — pressure

float | *string*

`char-riem-inv` only works with `euler` | `navier-stokes` and requires

- `rho` — density

float | *string*

- `u` — x-velocity

float | *string*

- `v` — y-velocity

float | *string*

- `w` — z-velocity

float | *string*

- `p` — static pressure

float | *string*

`no-slp-adia-wall` only works with `navier-stokes`

`no-slp-isot-wall` only works with `navier-stokes` and requires

- `u` — x-velocity of wall

float

- `v` — y-velocity of wall

float

- `w` — z-velocity of wall

float

- `cpTw` — product of specific heat capacity at constant pressure and temperature of wall

float

`no-slp-wall` only works with `ac-navier-stokes` and requires

- `u` — x-velocity of wall

float

- `v` — y-velocity of wall

float

- `w` — z-velocity of wall

float

`slp-adia-wall` only works with `euler` | `navier-stokes`

`slp-wall` only works with `ac-euler` | `ac-navier-stokes`

`sub-in-frv` only works with `navier-stokes` and requires

- `rho` — density

float | *string*

- **u** — x-velocity

float | string

- **v** — y-velocity

float | string

- **w** — z-velocity

float | string

sub-in-ftpttang only works with **navier-stokes** and requires

- **pt** — total pressure

float

- **cpTt** — product of specific heat capacity at constant pressure and total temperature

float

- **theta** — azimuth angle (in degrees) of inflow measured in the x-y plane relative to the positive x-axis

float

- **phi** — inclination angle (in degrees) of inflow measured relative to the positive z-axis

float

sub-out-fp only works with **navier-stokes** and requires

- **p** — static pressure

float | string

sup-in-fa only works with **euler | navier-stokes** and requires

- **rho** — density

float | string

- **u** — x-velocity

float | string

- **v** — y-velocity

float | string

- **w** — z-velocity

float | string

- **p** — static pressure

float | string

sup-out-fn only works with **euler | navier-stokes**

Example:

```
[soln-bcs-bcwallupper]
type = no-slp-isot-wall
cpTw = 10.0
u = 1.0
```

Simple periodic boundary conditions are supported; however, their behaviour is not controlled through the .ini file, instead it is handled at the mesh generation stage. Two faces may be tagged with `periodic_l_x` and `periodic_r_x`, where `x` is a unique integer for the pair of boundaries. Currently, only periodicity in a single cardinal direction is supported, for example, the planes $(x, y, 0)$ and $(x, y, 10)$.

2.2.3.2 [soln-ics]

Parameterises space $(x, y, [z])$ dependent initial conditions with

1. `rho` — initial density distribution for `euler` | `navier-stokes`:

string

2. `u` — initial x-velocity distribution for `euler` | `navier-stokes` | `ac-euler` | `ac-navier-stokes`:

string

3. `v` — initial y-velocity distribution for `euler` | `navier-stokes` | `ac-euler` | `ac-navier-stokes`:

string

4. `w` — initial z-velocity distribution for `euler` | `navier-stokes` | `ac-euler` | `ac-navier-stokes`:

string

5. `p` — initial static pressure distribution for `euler` | `navier-stokes` | `ac-euler` | `ac-navier-stokes`:

string

Example:

```
[soln-ics]
rho = 1.0
u = x*y*sin(y)
v = z
w = 1.0
p = 1.0/(1.0+x)
```

2.2.4 Nodal Point Sets

Solution point sets must be specified for each element type that is used and flux point sets must be specified for each interface type that is used. If anti-aliasing is enabled then quadrature point sets for each element and interface type that is used must also be specified. For example, a 3D mesh comprised only of prisms requires a solution point set for prism elements and flux point set for quadrilateral and triangular interfaces.

2.2.4.1 [solver-interfaces-line{-mg-porder}]

Parameterises the line interfaces, or if `-mg-porder` is suffixed the line interfaces at multi-p level `order`, with

1. `flux-pts` — location of the flux points on a line interface:

`gauss-legendre` | `gauss-legendre-lobatto`

2. `quad-deg` — degree of quadrature rule for anti-aliasing on a line interface:

int

3. `quad-pts` — name of quadrature rule for anti-aliasing on a line interface:

`gauss-legendre` | `gauss-legendre-lobatto`

Example:

```
[solver-interfaces-line]
flux-pts = gauss-legendre
quad-deg = 10
quad-pts = gauss-legendre
```

2.2.4.2 [solver-interfaces-tri{-mg-porder}]

Parameterises the triangular interfaces, or if -mg-porder is suffixed the triangular interfaces at multi-p level *order*, with

1. flux-pts — location of the flux points on a triangular interface:

williams-shunn

2. quad-deg — degree of quadrature rule for anti-aliasing on a triangular interface:

int

3. quad-pts — name of quadrature rule for anti-aliasing on a triangular interface:

williams-shunn | witherden-vincent

Example:

```
[solver-interfaces-tri]
flux-pts = williams-shunn
quad-deg = 10
quad-pts = williams-shunn
```

2.2.4.3 [solver-interfaces-quad{-mg-porder}]

Parameterises the quadrilateral interfaces, or if -mg-porder is suffixed the quadrilateral interfaces at multi-p level *order*, with

1. flux-pts — location of the flux points on a quadrilateral interface:

gauss-legendre | gauss-legendre-lobatto

2. quad-deg — degree of quadrature rule for anti-aliasing on a quadrilateral interface:

int

3. quad-pts — name of quadrature rule for anti-aliasing on a quadrilateral interface:

gauss-legendre | gauss-legendre-lobatto | witherden-vincent

Example:

```
[solver-interfaces-quad]
flux-pts = gauss-legendre
quad-deg = 10
quad-pts = gauss-legendre
```

2.2.4.4 [solver-elements-tri{-mg-porder}]

Parameterises the triangular elements, or if -mg-porder is suffixed the triangular elements at multi-p level *order*, with

1. **soln-pts** — location of the solution points in a triangular element:

williams-shunn

2. **quad-deg** — degree of quadrature rule for anti-aliasing in a triangular element:

int

3. **quad-pts** — name of quadrature rule for anti-aliasing in a triangular element:

williams-shunn | witherden-vincent

Example:

```
[solver-elements-tri]
soln-pts = williams-shunn
quad-deg = 10
quad-pts = williams-shunn
```

2.2.4.5 [solver-elements-quad{-mg-porder}]

Parameterises the quadrilateral elements, or if -mg-porder is suffixed the quadrilateral elements at multi-p level *order*, with

1. **soln-pts** — location of the solution points in a quadrilateral element:

gauss-legendre | gauss-legendre-lobatto

2. **quad-deg** — degree of quadrature rule for anti-aliasing in a quadrilateral element:

int

3. **quad-pts** — name of quadrature rule for anti-aliasing in a quadrilateral element:

gauss-legendre | gauss-legendre-lobatto | witherden-vincent

Example:

```
[solver-elements-quad]
soln-pts = gauss-legendre
quad-deg = 10
quad-pts = gauss-legendre
```

2.2.4.6 [solver-elements-hex{-mg-porder}]

Parameterises the hexahedral elements, or if -mg-porder is suffixed the hexahedral elements at multi-p level *order*, with

1. **soln-pts** — location of the solution points in a hexahedral element:

gauss-legendre | gauss-legendre-lobatto

2. **quad-deg** — degree of quadrature rule for anti-aliasing in a hexahedral element:

int

3. **quad-pts** — name of quadrature rule for anti-aliasing in a hexahedral element:

gauss-legendre | gauss-legendre-lobatto | witherden-vincent

Example:

```
[solver-elements-hex]
soln-pts = gauss-legendre
quad-deg = 10
quad-pts = gauss-legendre
```

2.2.4.7 [solver-elements-tet{-mg-porder}]

Parameterises the tetrahedral elements, or if -mg-porder is suffixed the tetrahedral elements at multi-p level *order*, with

1. soln-pts — location of the solution points in a tetrahedral element:

shunn-ham

2. quad-deg — degree of quadrature rule for anti-aliasing in a tetrahedral element:

int

3. quad-pts — name of quadrature rule for anti-aliasing in a tetrahedral element:

shunn-ham | witherden-vincent

Example:

```
[solver-elements-tet]
soln-pts = shunn-ham
quad-deg = 10
quad-pts = shunn-ham
```

2.2.4.8 [solver-elements-pri{-mg-porder}]

Parameterises the prismatic elements, or if -mg-porder is suffixed the prismatic elements at multi-p level *order*, with

1. soln-pts — location of the solution points in a prismatic element:

williams-shunn~gauss-legendre | williams-shunn~gauss-legendre-lobatto

2. quad-deg — degree of quadrature rule for anti-aliasing in a prismatic element:

int

3. quad-pts — name of quadrature rule for anti-aliasing in a prismatic element:

williams-shunn~gauss-legendre | williams-shunn~gauss-legendre-lobatto |
witherden-vincent

Example:

```
[solver-elements-pri]
soln-pts = williams-shunn~gauss-legendre
quad-deg = 10
quad-pts = williams-shunn~gauss-legendre
```

2.2.4.9 [solver-elements-pyr{-mg-*porder*}]

Parameterises the pyramidal elements, or if -mg-*porder* is suffixed the pyramidal elements at multi-p level *order*, with

1. **soln-pts** — location of the solution points in a pyramidal element:
gauss-legendre | gauss-legendre-lobatto
2. **quad-deg** — degree of quadrature rule for anti-aliasing in a pyramidal element:
int
3. **quad-pts** — name of quadrature rule for anti-aliasing in a pyramidal element:
witherden-vincent

Example:

```
[solver-elements-pyr]
soln-pts = gauss-legendre
quad-deg = 10
quad-pts = witherden-vincent
```

2.2.5 Plugins

Plugins allow for powerful additional functionality to be swapped in and out. It is possible to load multiple instances of the same plugin by appending a tag, for example:

```
[soln-plugin-writer]
...
[soln-plugin-writer-2]
...
[soln-plugin-writer-three]
...
```

2.2.5.1 [soln-plugin-writer]

Periodically write the solution to disk in the pyfrs format. Parameterised with

1. **dt-out** — write to disk every dt-out time units:
float
2. **basedir** — relative path to directory where outputs will be written:
string
3. **basename** — pattern of output names:
string
4. **post-action** — command to execute after writing the file:
string
5. **post-action-mode** — how the post-action command should be executed:
blocking | non-blocking

4. **region** — region to be written, specified as either the entire domain using `*`, a cuboidal sub-region via diametrically opposite vertices, or a sub-region of elements that have faces on a specific domain boundary via the name of the domain boundary

`* | [(x, y, [z]), (x, y, [z])] | string`

Example:

```
[soln-plugin-writer]
dt-out = 0.01
basedir =
basename = files-{t:.2f}
post-action = echo "Wrote file {soln} at time {t} for mesh {mesh}."
post-action-mode = blocking
region = [(-5, -5, -5), (5, 5, 5)]
```

2.2.5.2 [soln-plugin-fluidforce-name]

Periodically integrates the pressure and viscous stress on the boundary labelled `name` and writes out the resulting force vectors to a CSV file. Parameterised with

1. **nsteps** — integrate every `nsteps`:

`int`

2. **file** — output file path; should the file already exist it will be appended to:

`string`

3. **header** — if to output a header row or not:

`boolean`

Example:

```
[soln-plugin-fluidforce-wing]
nsteps = 10
file = wing-forces.csv
header = true
```

2.2.5.3 [soln-plugin-nancheck]

Periodically checks the solution for NaN values. Parameterised with

1. **nsteps** — check every `nsteps`:

`int`

Example:

```
[soln-plugin-nancheck]
nsteps = 10
```

2.2.5.4 [soln-plugin-residual]

Periodically calculates the residual and writes it out to a CSV file. Parameterised with

1. `nsteps` — calculate every `nsteps`:

int

2. `file` — output file path; should the file already exist it will be appended to:

string

3. `header` — if to output a header row or not:

boolean

Example:

```
[soln-plugin-residual]
nsteps = 10
file = residual.csv
header = true
```

2.2.5.5 [soln-plugin-dtstats]

Write time-step statistics out to a CSV file. Parameterised with

1. `flushsteps` — flush to disk every `flushsteps`:

int

2. `file` — output file path; should the file already exist it will be appended to:

string

3. `header` — if to output a header row or not:

boolean

Example:

```
[soln-plugin-dtstats]
flushsteps = 100
file = dtstats.csv
header = true
```

2.2.5.6 [soln-plugin-pseudostats]

Write pseudo-step convergence history out to a CSV file. Parameterised with

1. `flushsteps` — flush to disk every `flushsteps`:

int

2. `file` — output file path; should the file already exist it will be appended to:

string

3. `header` — if to output a header row or not:

boolean

Example:

```
[soln-plugin-pseudostats]
flushsteps = 100
file = pseudostats.csv
header = true
```

2.2.5.7 [soln-plugin-sampler]

Periodically samples specific points in the volume and writes them out to a CSV file. The plugin actually samples the solution point closest to each sample point, hence a slight discrepancy in the output sampling locations is to be expected. A nearest-neighbour search is used to locate the closest solution point to the sample point. The location process automatically takes advantage of `scipy.spatial.cKDTree` where available. Parameterised with

1. `nsteps` — sample every `nsteps`:

int

2. `samp-pts` — list of points to sample:

`[(x, y), (x, y), ...] | [(x, y, z), (x, y, z), ...]`

3. `format` — output variable format:

`primitive | conservative`

4. `file` — output file path; should the file already exist it will be appended to:

string

5. `header` — if to output a header row or not:

boolean

Example:

```
[soln-plugin-sampler]
nsteps = 10
samp-pts = [(1.0, 0.7, 0.0), (1.0, 0.8, 0.0)]
format = primitive
file = point-data.csv
header = true
```

2.2.5.8 [soln-plugin-tavg]

Time average quantities. Parameterised with

1. `nsteps` — accumulate the average every `nsteps` time steps:

int

2. `dt-out` — write to disk every `dt-out` time units:

float

3. `tstart` — time at which to start accumulating average data:

float

4. `mode` — output file accumulation mode:

continuous | windowed

Windowed outputs averages over each dt-out period. Whereas, continuous outputs averages over all dt-out periods thus far completed within a given invocation of PyFR. The default is windowed.

5. **basedir** — relative path to directory where outputs will be written:

string

6. **basename** — pattern of output names:

string

7. **precision** — output file number precision:

single | double

8. **region** — region to be averaged, specified as either the entire domain using *, a cuboidal sub-region via diametrically opposite vertices, or a sub-region of elements that have faces on a specific domain boundary via the name of the domain boundary

* | [(x, y, [z]), (x, y, [z])] | *string*

9. **avg-name** — expression to time average, written as a function of the primitive variables and gradients thereof; multiple expressions, each with their own *name*, may be specified:

string

10. **fun-avg-name** — expression to compute at file output time, written as a function of any ordinary average terms; multiple expressions, each with their own *name*, may be specified:

string

As fun-avg terms are evaluated at write time, these are only indirectly effected by the averaging mode.

Example:

```
[soln-plugin-tavg]
nsteps = 10
dt-out = 2.0
mode = windowed
basedir =
basename = files-{t:06.2f}

avg-u = u
avg-v = v
avg-uu = u*u
avg-vv = v*v
avg-uv = u*v

fun-avg-upup = uu - u*u
fun-avg-vpvp = vv - v*v
fun-avg-upvp = uv - u*v
fun-avg-urms = sqrt(uu - u*u + vv - v*v)
```

2.2.5.9 [soln-plugin-integrate]

Integrate quantities over the computational domain. Parameterised with:

1. `nsteps` — calculate the integral every `nsteps` time steps:

int

2. `file` — output file path; should the file already exist it will be appended to:

string

3. `header` — if to output a header row or not:

boolean

4. `int-name` — expression to integrate, written as a function of the primitive variables and gradients thereof; multiple expressions, each with their own *name*, may be specified:

string

Example:

```
[soln-plugin-integrate]
nsteps = 50
file = integral.csv
header = true
vor1 = (grad_w_y - grad_v_z)
vor2 = (grad_u_z - grad_w_x)
vor3 = (grad_v_x - grad_u_y)

int-E = rho*(u*u + v*v + w*w)
int-enst = rho*%vor1s*%vor1s + %vor2s*%vor2s + %vor3s*%vor3s
```

2.2.6 Additional Information

The *INI* file format is very versatile. A feature that can be useful in defining initial conditions is the substitution feature and this is demonstrated in the [\[soln-plugin-integrate\]](#) example.

To prevent situations where you have solutions files for unknown configurations, the contents of the `.ini` file is added as an attribute to `.pyfrs` files. These files use the HDF5 format and can be straightforwardly probed with tools such as `h5dump`.

DEVELOPER GUIDE

3.1 A Brief Overview of the PyFR Framework

3.1.1 Where to Start

The symbolic link `pyfr.scripts.pyfr` points to the script `pyfr.scripts.main`, which is where it all starts! Specifically, the function `process_run` calls the function `_process_common`, which in turn calls the function `get_solver`, returning an Integrator – a composite of a *Controller* and a *Stepper*. The Integrator has a method named `run`, which is then called to run the simulation.

3.1.2 Controller

A *Controller* acts to advance the simulation in time. Specifically, a *Controller* has a method named `advance_to` which advances a *System* to a specified time. There are three types of physical-time *Controller* available in PyFR 1.12.0:

`StdNoneController` [Click to show](#)

```
class pyfr.integrators.std.controllers.StdNoneController(*args, **kwargs)

    _accept_step(dt, idxcurr, err=None)
    _add(*args)
    _check_abort()
    _get_axnpby_kerns(*rs, subdims=None)
    _get_gndofs()
    _get_kernels(name, nargs, **kwargs)
    _get_plugins()
    _init_reg_banks()
    _prepare_reg_banks(*bidxes)
    _reject_step(dt, idxold, err=None)
    advance_to(t)
    call_plugin_dt(dt)
    property cfgmeta
    collect_stats(stats)
```

```
controller_name = 'none'  
property controller_needs_errest  
formulation = 'std'  
property grad_soln  
property nsteps  
run()  
property soln  
step(t, dt)
```

StdPIController [Click to show](#)

```
class pyfr.integrators.std.controllers.StdPIController(*args, **kwargs)  
  
    _accept_step(dt, idxcurr, err=None)  
    _add(*args)  
    _check_abort()  
    _errest(x, y, z)  
    _get_axnpby_kerns(*rs, subdims=None)  
    _get_errest_kerns()  
    _get_gndofs()  
    _get_kernels(name, nargs, **kwargs)  
    _get_plugins()  
    _init_reg_banks()  
    _prepare_reg_banks(*bidxes)  
    _reject_step(dt, idxold, err=None)  
    advance_to(t)  
    call_plugin_dt(dt)  
    property cfgmeta  
    collect_stats(stats)  
    controller_name = 'pi'  
    property controller_needs_errest  
    formulation = 'std'  
    property grad_soln  
    property nsteps  
    run()  
    property soln  
    step(t, dt)
```

DualNoneController [Click to show](#)

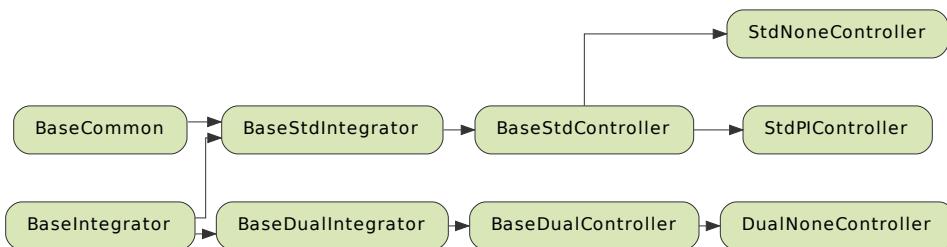

```

class pyfr.integrators.dual.phys.controllers.DualNoneController(*args, **kwargs)

    _accept_step(idxcurr)
    _check_abort()
    _get_plugins()
    advance_to(t)
    call_plugin_dt(dt)
    property cfgmeta
    collect_stats(stats)
    controller_name = 'none'
    formulation = 'dual'
    property grad_soln
    property nsteps
    property pseudostepinfo
    run()
    property soln
    step(t, dt)
    property system

```

Types of physical-time *Controller* are related via the following inheritance diagram:

There are two types of pseudo-time *Controller* available in PyFR 1.12.0:

DualNonePseudoController [Click to show](#)

```
class pyfr.integrators.dual.pseudo.pseudocontrollers.DualNonePseudoController(*args,
                                                                           **kwargs)

    _add(*args)
    _get_axnpby_kerns(*rs, subdims=None)
    _get_errest_kerns()
    _get_gndofs()
    _get_kernels(name, nargs, **kwargs)
    _init_reg_banks()
    _prepare_reg_banks(*bidxes)
    property _pseudo stepper regidx
    _resid(dtau, x)
    property _stepper stepper regidx
    _update_pseudostepinfo(niters, resid)
    aux_nregs = 0
    convmon(i, minniters)
    finalise_pseudo_advance(currsoln)
    formulation = 'dual'
    pseudo_advance(tcurr)
    pseudo_controller_name = 'none'
    pseudo_controller_needs_lerrest = False
```

DualPIPpseudoController [Click to show](#)

```
class pyfr.integrators.dual.pseudo.pseudocontrollers.DualPIPpseudoController(*args,
                                                                           **kwargs)

    _add(*args)
    _get_axnpby_kerns(*rs, subdims=None)
    _get_errest_kerns()
    _get_gndofs()
    _get_kernels(name, nargs, **kwargs)
    _init_reg_banks()
    _prepare_reg_banks(*bidxes)
    property _pseudo stepper regidx
    _resid(dtau, x)
    property _stepper stepper regidx
    _update_pseudostepinfo(niters, resid)
```

```

aux_nregs = 0
convmon(i, minniters)
finalise_pseudo_advance(currsoln)
formulation = 'dual'
localerrest( errbank )
pseudo_advance(tcurr)
pseudo_controller_name = 'local-pi'
pseudo_controller_needs_lerrest = True

```

Types of pseudo-time *Controller* are related via the following inheritance diagram:

3.1.3 Stepper

A *Stepper* acts to advance the simulation by a single time-step. Specifically, a *Stepper* has a method named `step` which advances a *System* by a single time-step. There are eight types of *Stepper* available in PyFR 1.12.0:

StdEulerStepper [Click to show](#)

```

Note that DualDenseRKPseudoStepper includes families of *PseudoStepper* whose coefficients are read from .txt files named thus:

{scheme name}-s{stage count}-p{temporal order}-sp{optimal spatial polynomial order}.txt

Types of *PseudoStepper* are related via the following inheritance diagram:

3.1.5 System

A *System* holds information/data for the system, including *Elements*, *Interfaces*, and the *Backend* with which the simulation is to run. A *System* has a method named `rhs`, which obtains the divergence of the flux (the ‘right-hand-side’) at each solution point. The method `rhs` invokes various kernels which have been pre-generated and loaded into queues. A *System* also has a method named `_gen_kernels` which acts to generate all the kernels required by a particular *System*. A kernel is an instance of a ‘one-off’ class with a method named `run` that implements the required kernel functionality. Individual kernels are produced by a kernel provider. PyFR 1.12.0 has various types of kernel provider. A *Pointwise Kernel Provider* produces point-wise kernels such as Riemann solvers and flux functions etc. These point-wise kernels are specified using an in-built platform-independent templating language derived from *Mako*, henceforth referred to as *PyFR-Mako*. There are four types of *System* available in PyFR 1.12.0:

xchg_view(matmap, rmap, cmap, rstridemap=None, vshape=(), tags={})
```

Types of *Backend* are related via the following inheritance diagram:

3.1.9 Pointwise Kernel Provider

A *Pointwise Kernel Provider* produces point-wise kernels. Specifically, a *Pointwise Kernel Provider* has a method named `register`, which adds a new method to an instance of a *Pointwise Kernel Provider*. This new method, when called, returns a kernel. A kernel is an instance of a ‘one-off’ class with a method named `run` that implements the required kernel functionality. The kernel functionality itself is specified using *PyFR-Mako*. Hence, a *Pointwise Kernel Provider* also has a method named `_render_kernel`, which renders *PyFR-Mako* into low-level platform-specific code. The `_render_kernel` method first sets the context for Mako (i.e. details about the *Backend* etc.) and then uses Mako to begin rendering the *PyFR-Mako* specification. When Mako encounters a `pyfr:kernel` an instance of a *Kernel Generator* is created, which is used to render the body of the `pyfr:kernel`. There are four types of *Pointwise Kernel Provider* available in PyFR 1.12.0:

CUDAPointwiseKernelProvider [Click to show](#)

```
class pyfr.backends.cuda.provider.CUDAPointwiseKernelProvider(backend)

    _build_arglst(dims, argn, argt, argdict)
```

```

_build_kernel(name, src, argtypes)
_instantiate_kernel(dims, fun, arglst)
_render_kernel(name, mod, extrns, tplargs)
kernel_generator_cls
    alias of pyfr.backends.cuda.generator.CUDAKernelGenerator
register(mod)

```

HIPPointwiseKernelProvider [Click to show](#)

```
class pyfr.backends.hip.provider.HIPPointwiseKernelProvider(backend)
```

```

_build_arglst(dims, argn, argt, argdict)
_build_kernel(name, src, argtypes)
_instantiate_kernel(dims, fun, arglst)
_render_kernel(name, mod, extrns, tplargs)
kernel_generator_cls
    alias of pyfr.backends.hip.generator.HIPKernelGenerator
register(mod)

```

OpenCLPointwiseKernelProvider [Click to show](#)

```
class pyfr.backends.opencl.provider.OpenCLPointwiseKernelProvider(backend)
```

```

_build_arglst(dims, argn, argt, argdict)
_build_kernel(name, src, argtypes)
_instantiate_kernel(dims, fun, arglst)
_render_kernel(name, mod, extrns, tplargs)
kernel_generator_cls
    alias of pyfr.backends.opencl.generator.OpenCLKernelGenerator
register(mod)

```

OpenMPPointwiseKernelProvider [Click to show](#)

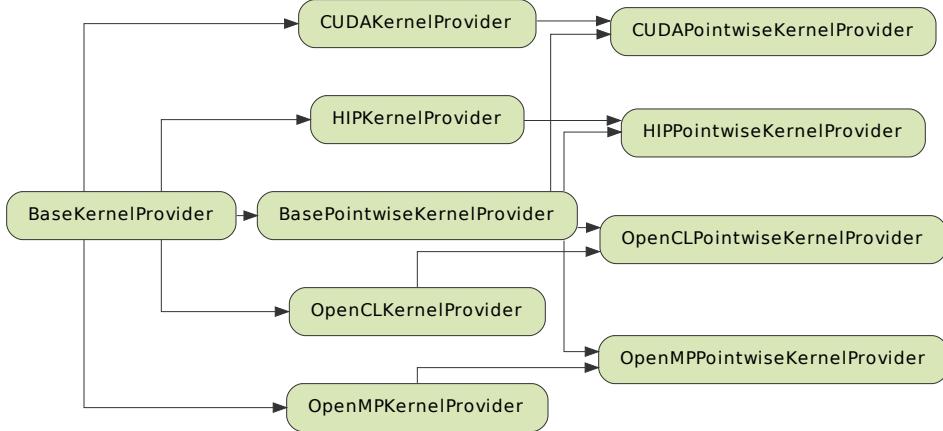

```
class pyfr.backends.openmp.provider.OpenMPPointwiseKernelProvider(backend)
```

```

_build_arglst(dims, argn, argt, argdict)
_build_kernel(name, src, argtypes, restype=None)
_instantiate_kernel(dims, fun, arglst)
_render_kernel(name, mod, extrns, tplargs)
kernel_generator_cls
    alias of pyfr.backends.openmp.generator.OpenMPKernelGenerator
register(mod)

```

Types of *Pointwise Kernel Provider* are related via the following inheritance diagram:

3.1.10 Kernel Generator

A *Kernel Generator* renders the *PyFR-Mako* in a `pyfr:kernel` into low-level platform-specific code. Specifically, a *Kernel Generator* has a method named `render`, which applies *Backend* specific regex and adds *Backend* specific ‘boiler plate’ code to produce the low-level platform-specific source – which is compiled, linked, and loaded. There are four types of *Kernel Generator* available in PyFR 1.12.0:

`CUDAKernelGenerator` [Click to show](#)

```
class pyfr.backends.cuda.generator.CUDAKernelGenerator(*args, **kwargs)

    _deref_arg_array_1d(arg)
    _deref_arg_array_2d(arg)
    _deref_arg_view(arg)
    _render_body(body)
    _render_spec()
    argspec()
    ldim_size(name, *factor)
    needs_ldim(arg)
    render()
```

`HIPKernelGenerator` [Click to show](#)

```
class pyfr.backends.hip.generator.HIPKernelGenerator(*args, **kwargs)
```

```
_deref_arg_array_1d(arg)
_deref_arg_array_2d(arg)
_deref_arg_view(arg)
_render_body(body)
_render_spec()
argspec()
ldim_size(name, *factor)
needs_ldim(arg)
render()
```

OpenCLKernelGenerator [Click to show](#)

```
class pyfr.backends.opencl.generator.OpenCLKernelGenerator(*args, **kwargs)
```

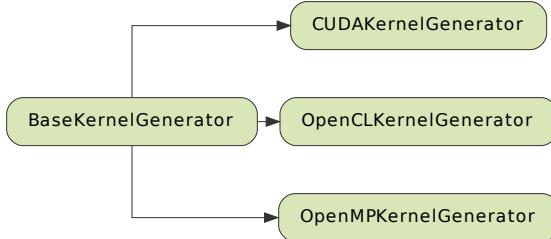

```
_deref_arg_array_1d(arg)
_deref_arg_array_2d(arg)
_deref_arg_view(arg)
_render_body(body)
_render_spec()
argspec()
ldim_size(name, *factor)
needs_ldim(arg)
render()
```

OpenMPKernelGenerator [Click to show](#)

```
class pyfr.backends.openmp.generator.OpenMPKernelGenerator(name, ndim, args, body, fpdtype)
```

```
_deref_arg_array_1d(arg)
_deref_arg_array_2d(arg)
_deref_arg_view(arg)
_render_body(body)
_render_spec()
argspec()
ldim_size(name, *factor)
needs_ldim(arg)
render()
```

Types of *Kernel Generator* are related via the following inheritance diagram:

3.2 PyFR-Mako

3.2.1 PyFR-Mako Kernels

PyFR-Mako kernels are specifications of point-wise functionality that can be invoked directly from within PyFR. They are opened with a header of the form:

```
<%pyfr:kernel name='kernel-name' ndim='data-dimensionality' [argument-name='argument-
intent argument-attribute argument-data-type' ...]>
```

where

1. **kernel-name** — name of kernel
string
2. **data-dimensionality** — dimensionality of data
int
3. **argument-name** — name of argument
string
4. **argument-intent** — intent of argument
in | out | inout
5. **argument-attribute** — attribute of argument
mpi | scalar | view
6. **argument-data-type** — data type of argument
string

and are closed with a footer of the form:

```
</%pyfr:kernel>
```

3.2.2 PyFR-Mako Macros

PyFR-Mako macros are specifications of point-wise functionality that cannot be invoked directly from within PyFR, but can be embedded into PyFR-Mako kernels. PyFR-Mako macros can be viewed as building blocks for PyFR-mako kernels. They are opened with a header of the form:

```
<%pyfr:macro name='macro-name' params='[parameter-name, ...]'>
```

where

1. **macro-name** — name of macro
string
2. **parameter-name** — name of parameter
string

and are closed with a footer of the form:

```
</%pyfr:macro>
```

PyFR-Mako macros are embedded within a kernel using an expression of the following form:

```
 ${pyfr.expand('macro-name', ['parameter-name', ...])};
```

where

1. **macro-name** — name of the macro
string
2. **parameter-name** — name of parameter
string

3.2.3 Syntax

3.2.3.1 Basic Functionality

Basic functionality can be expressed using a restricted subset of the C programming language. Specifically, use of the following is allowed:

1. **+, -, *, /** — basic arithmetic
2. **sin, cos, tan** — basic trigonometric functions
3. **exp** — exponential
4. **pow** — power
5. **fabs** — absolute value
6. **output = (condition ? satisfied : unsatisfied)** — ternary if
7. **min** — minimum
8. **max** — maximum

However, conditional if statements, as well as for/while loops, are not allowed.

3.2.3.2 Expression Substitution

Mako expression substitution can be used to facilitate PyFR-Mako kernel specification. A Python expression `expression` prescribed thus `${expression}` is substituted for the result when the PyFR-Mako kernel specification is interpreted at runtime.

Example:

```
E = s[${ndims - 1}]
```

3.2.3.3 Conditionals

Mako conditionals can be used to facilitate PyFR-Mako kernel specification. Conditionals are opened with `% if condition:` and closed with `% endif`. Note that such conditionals are evaluated when the PyFR-Mako kernel specification is interpreted at runtime, they are not embedded into the low-level kernel.

Example:

```
% if ndims == 2:  
    fout[0][1] += t_xx;      fout[1][1] += t_xy;  
    fout[0][2] += t_xy;      fout[1][2] += t_yy;  
    fout[0][3] += u*t_xx + v*t_xy + ${-c['mu']*c['gamma']/c['Pr']]*T_x;  
    fout[1][3] += u*t_xy + v*t_yy + ${-c['mu']*c['gamma']/c['Pr']]*T_y;  
% endif
```

3.2.3.4 Loops

Mako loops can be used to facilitate PyFR-Mako kernel specification. Loops are opened with `% for condition:` and closed with `% endfor`. Note that such loops are unrolled when the PyFR-Mako kernel specification is interpreted at runtime, they are not embedded into the low-level kernel.

Example:

```
% for i in range(ndims):  
    rhov[ ${i} ] = s[ ${i + 1} ];  
    v[ ${i} ] = invrho*rhov[ ${i} ];  
% endfor
```

EXAMPLES

4.1 Euler Equations

4.1.1 2D Euler Vortex

Proceed with the following steps to run a parallel 2D Euler vortex simulation on a structured mesh:

1. Create a working directory called `euler_vortex_2d/`
2. Copy the configuration file `PyFR/examples/euler_vortex_2d/euler_vortex_2d.ini` into `euler_vortex_2d/`
3. Copy the `Gmsh` file `PyFR/examples/euler_vortex_2d/euler_vortex_2d.msh` into `euler_vortex_2d/`
4. Run `pyfr` to convert the `Gmsh` mesh file into a PyFR mesh file called `euler_vortex_2d.pyfrm`:

```
pyfr import euler_vortex_2d.msh euler_vortex_2d.pyfrm
```

5. Run `pyfr` to partition the PyFR mesh file into two pieces:

```
pyfr partition 2 euler_vortex_2d.pyfrm .
```

6. Run `pyfr` to solve the Euler equations on the mesh, generating a series of PyFR solution files called `euler_vortex_2d*.pyfrs`:

```
mpiexec -n 2 pyfr run -b cuda -p euler_vortex_2d.pyfrm euler_vortex_2d.ini
```

7. Run `pyfr` on the solution file `euler_vortex_2d-100.0.pyfrs` converting it into an unstructured VTK file called `euler_vortex_2d-100.0.vtu`:

```
pyfr export euler_vortex_2d.pyfrm euler_vortex_2d-100.0.pyfrs euler_vortex_2d-100.0.  
vtu
```

8. Visualise the unstructured VTK file in Paraview

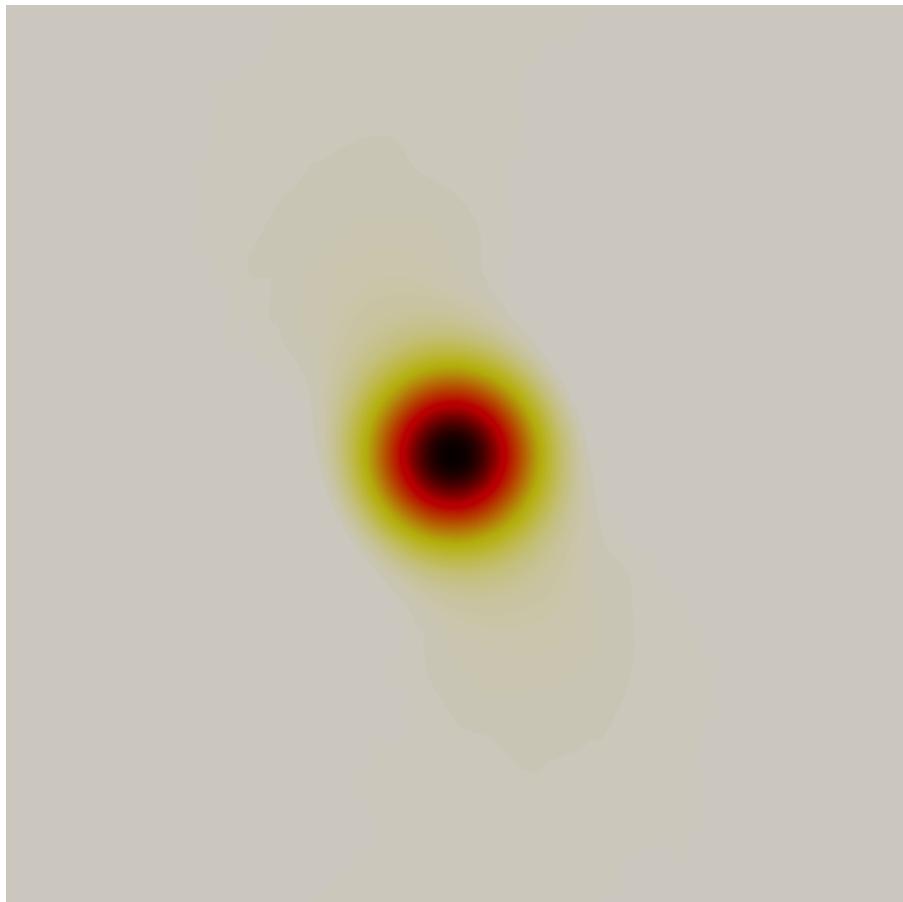

Fig. 1: Colour map of density distribution at 100 time units.

4.2 Compressible Navier–Stokes Equations

4.2.1 2D Couette Flow

Proceed with the following steps to run a serial 2D Couette flow simulation on a mixed unstructured mesh:

1. Create a working directory called `couette_flow_2d/`
2. Copy the configuration file `PyFR/examples/couette_flow_2d/couette_flow_2d.ini` into `couette_flow_2d/`
3. Copy the `Gmsh` mesh file `PyFR/examples/couette_flow_2d/couette_flow_2d.msh` into `couette_flow_2d/`
4. Run `pyfr` to convert the `Gmsh` mesh file into a PyFR mesh file called `couette_flow_2d.pyfrm`:

```
pyfr import couette_flow_2d.msh couette_flow_2d.pyfrm
```

5. Run `pyfr` to solve the Navier-Stokes equations on the mesh, generating a series of PyFR solution files called `couette_flow_2d-* .pyfrs`:

```
pyfr run -b cuda -p couette_flow_2d.pyfrm couette_flow_2d.ini
```

6. Run `pyfr` on the solution file `couette_flow_2d-040.pyfrs` converting it into an unstructured VTK file called `couette_flow_2d-040.vtu`:

```
pyfr export couette_flow_2d.pyfrm couette_flow_2d-040.pyfrs couette_flow_2d-040.vtu
```

7. Visualise the unstructured VTK file in Paraview

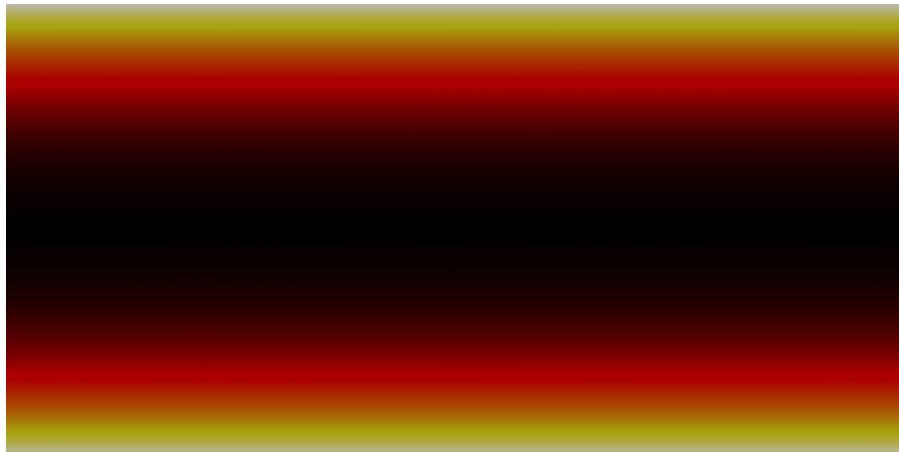

Fig. 2: Colour map of steady-state density distribution.

4.3 Incompressible Navier–Stokes Equations

4.3.1 2D Incompressible Cylinder Flow

Proceed with the following steps to run a serial 2D incompressible cylinder flow simulation on a mixed unstructured mesh:

1. Create a working directory called `inc_cylinder_2d/`
2. Copy the configuration file `PyFR/examples/inc_cylinder_2d/inc_cylinder_2d.ini` into `inc_cylinder_2d/`
3. Copy the compressed `Gmsh` mesh file `PyFR/examples/inc_cylinder_2d/inc_cylinder_2d.msh.gz` into `inc_cylinder_2d/`
4. Unzip the file and run `pyfr` to convert the `Gmsh` mesh file into a PyFR mesh file called `inc_cylinder_2d.pyfrm`:

```
zcat inc_cylinder_2d.msh.gz | pyfr import -tgms - inc_cylinder_2d.pyfrm
```

5. Run `pyfr` to solve the incompressible Navier-Stokes equations on the mesh, generating a series of PyFR solution files called `inc_cylinder_2d-* .pyfrs`:

```
pyfr run -b cuda -p inc_cylinder_2d.pyfrm inc_cylinder_2d.ini
```

6. Run `pyfr` on the solution file `inc_cylinder_2d-75.00.pyfrs` converting it into an unstructured VTK file called `inc_cylinder_2d-75.00.vtu`:

```
pyfr export inc_cylinder_2d.pyfrm inc_cylinder_2d-75.00.pyfrs inc_cylinder_2d-75.00.  
vtu
```

7. Visualise the unstructured VTK file in Paraview

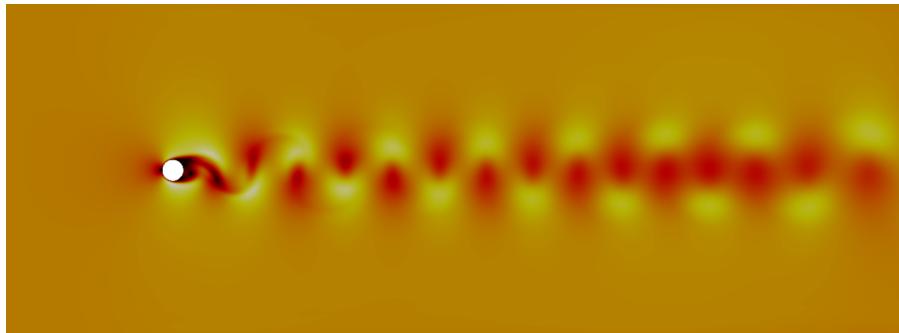

Fig. 3: Colour map of velocity magnitude distribution at 75 time units.
